inspiration

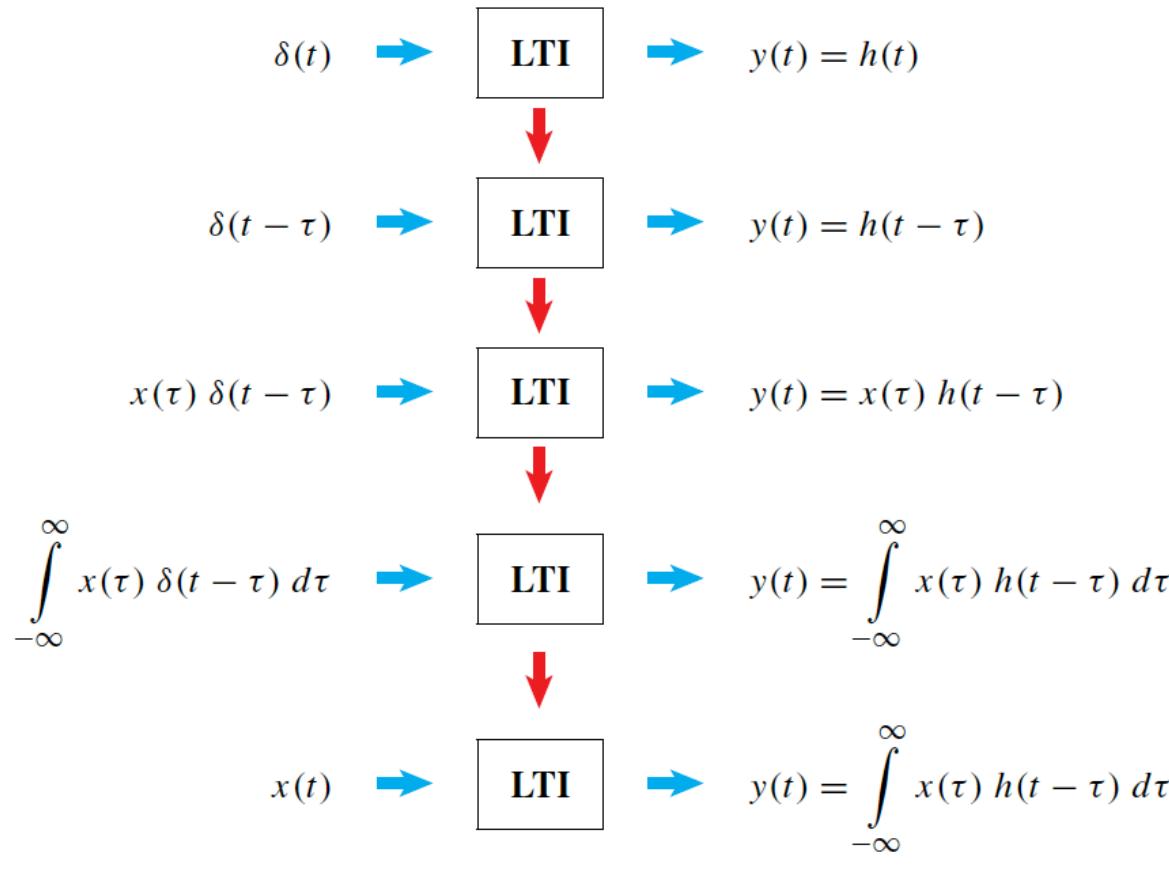

- “Chance does not speak essentially through words nor can it be seen in their convolution. It is the eruption of language, its sudden appearance. It's not a night twinkle with stars, an illuminated sleep, nor a drowsy vigil. It is the very edge of consciousness.” Michel Foucault
- “life is convoluted when there are several doors yet to open, but keys in meander of thoughts due to no prioritization” Harshitha Lakshmi
- “i am somehow less interested in the weight and convolutions of Einstein’s brain than in the near certainty that people of equal talent have lived and died in cotton fields and sweatshops” Steven Jay Gould

convolution

- the impulse response of a system is a way of characterizing the system; meaning that if we know the impulse response, we can find the response of the system to any other input

LTI System with Zero Initial Conditions

convolution

The following integral

$$y(t) = \int_{-\infty}^{\infty} x(\tau)h(t - \tau)d\tau$$

is called the CONVOLUTION INTEGRAL
in general,

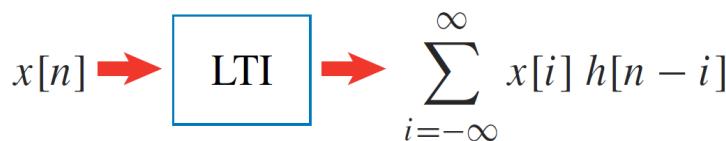

$$x_1(t) * x_2(t) == \int_{-\infty}^{\infty} x_1(\tau)x_2(t - \tau)d\tau$$

discrete vs. continuous convolution

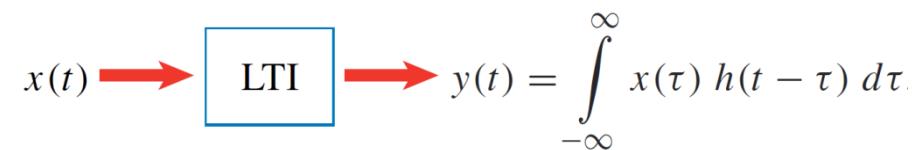

Discrete Time:

$$y[n] = x[n] * h[n] = \sum_{i=-\infty}^{\infty} x[i] h[n - i]$$

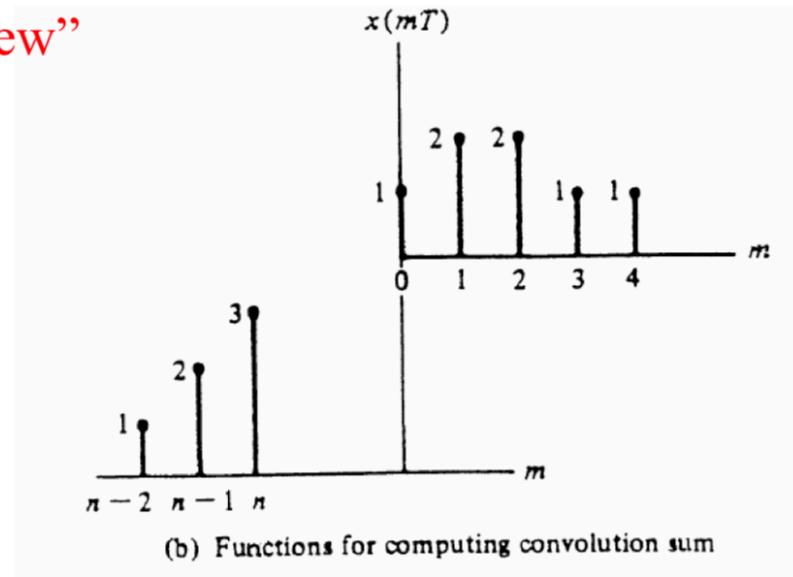

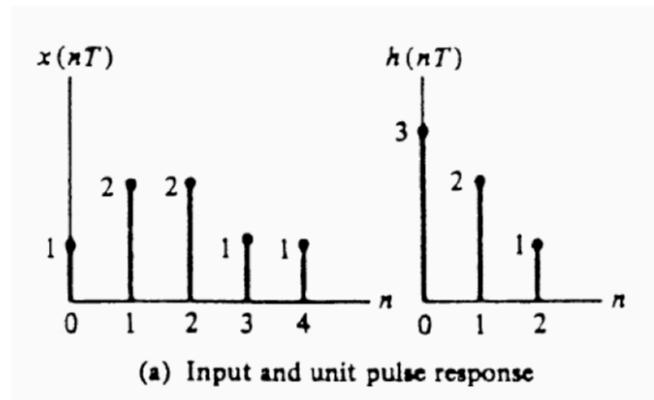

Continuous Time:

$$y(t) = x(t) * h(t) = \int_{-\infty}^{\infty} x(\tau) h(t - \tau) d\tau$$

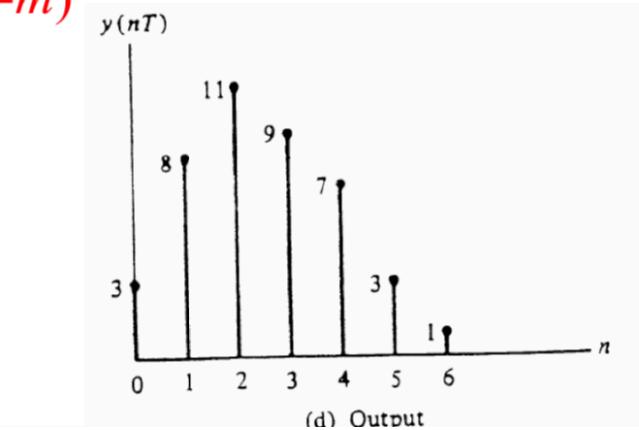

Convolution Example “Table view”

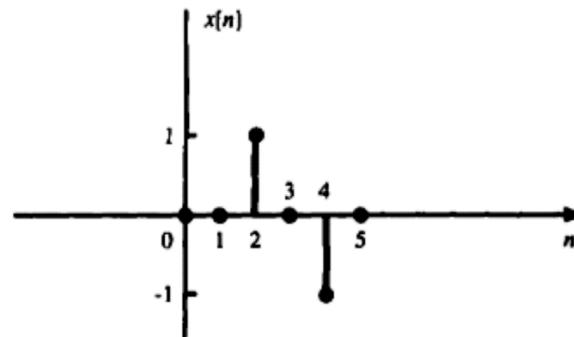

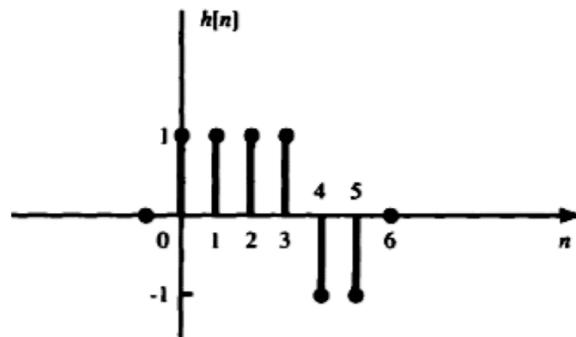

Samples $x(mT)$

	0	0	1	2	2	1	1	0
$n = 0$	1	2	3	0	0	0	0	0
$n = 1$	0	1	2	3	0	0	0	0
$n = 2$	0	0	1	2	3	0	0	0
$n = 3$	0	0	0	1	2	3	0	0
$n = 4$	0	0	0	0	1	2	3	0
$n = 5$	0	0	0	0	0	1	2	3
$n = 6$	0	0	0	0	0	0	1	2

(c) Table for evaluating summation

The impulse response $h[n]$ of a discrete-time LTI system. (a). Determine and sketch the output $y[n]$ of this system to the input $x[n]$. (b) without using the convolution technique.

$$h[n] = \delta[n] + \delta[n-1] + \delta[n-2] + \delta[n-3] - \delta[n-4] - \delta[n-5],$$

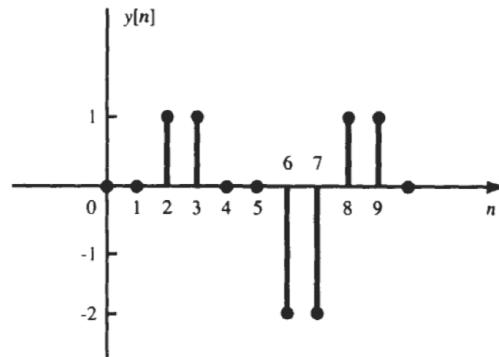

$$x[n] = \delta[n-2] - \delta[n-4]$$

$$\begin{aligned} x[n] * h[n] &= x[n] * \{\delta[n] + \delta[n-1] + \delta[n-2] + \delta[n-3] - \delta[n-4] - \delta[n-5]\} \\ &= x[n] + x[n-1] + x[n-2] + x[n-3] - x[n-4] - x[n-5] \end{aligned}$$

$$\begin{aligned} y[n] &= \delta[n-2] - \delta[n-4] + \delta[n-3] - \delta[n-5] + \delta[n-4] - \delta[n-6] + \delta[n-5] - \delta[n-7] \\ &\quad - \delta[n-6] + \delta[n-8] - \delta[n-7] + \delta[n-9] \end{aligned}$$

$$= \delta[n-2] + \delta[n-3] - 2\delta[n-6] - 2\delta[n-7] + \delta[n-8] + \delta[n-9]$$

$$y[n] = \{0, 0, 1, 1, 0, 0, -2, -2, 1, 1\}$$

convolution - properties (1)

1. Commutative Property

$$\begin{aligned}x_1(t) * x_2(t) &= \int_{-\infty}^{\infty} x_1(\tau)x_2(t - \tau)d\tau \\&= \int_{-\infty}^{\infty} x_2(\tau)x_1(t - \tau)d\tau \\&= x_2(t) * x_1(t)\end{aligned}$$

2. Associative Property

$$x_1(t) * [x_2(t) * x_3(t)] = [x_1(t) * x_2(t)] * x_3(t)$$

3. Distributive Property

$$x_1(t) * [x_2(t) + x_3(t)] = x_1(t) * x_2(t) + x_1(t) * x_3(t)$$

4. Shift Property

if $x_1(t) * x_2(t) = c(t)$ then

$$x_1(t) * x_2(t - T) = x_1(t - T) * x_2(t) = c(t - T),$$

also

$$x_1(t - T_1) * x_2(t - T_2) = c(t - T_1 - T_2)$$

1

convolution - properties (2)

5. Impulse Property

$$x(t) * \delta(t) = \int_{-\infty}^{\infty} x(\tau)\delta(t - i\tau)d\tau = x(t)$$

6. Width Property

if $x_1(t)$ duration is T_1 and $x_2(t)$ duration is T_2 then
the duration of $x_1(t) * x_2(t)$ is $T_1 + T_2$

7. Causality Property

if both system's impulse $h(t)$ and input $x(t)$ are causal, then so is the output

$$\begin{aligned}y(t) &= x(t) * h(t) = \int_{0^-}^t x(\tau)h(t - \tau)d\tau, t \geq 0 \\&= \int_{0^-}^t h(\tau)x(t - \tau)d\tau \\&= 0, t < 0\end{aligned}$$

convolution - properties - summary

Commutative: $f_1(t) * f_2(t) = f_2(t) * f_1(t)$

Associative: $f_1(t) * [f_2(t) * f_3(t)] = [f_1(t) * f_2(t)] * f_3(t)$

Distributive: $f_1(t) * [f_2(t) + f_3(t)] = f_1(t) * f_2(t) + f_1(t) * f_3(t)$

Shift Property: If $f_1(t) * f_2(t) = c_1(t)$ then $f_1(t) * f_2(t - T) = c_1(t - T)$
 $f_1(t - T) * f_2(t) = c_1(t - T)$

Convolution with an impulse: $f_1(t) * \delta(t) = f(t)$

Width Property: If $f_1(t)$ and $f_2(t)$ have durations of T_1 and T_2 respectively, then the duration of $f_1(t) * f_2(t)$ is $T_1 + T_2$.

convolution - example

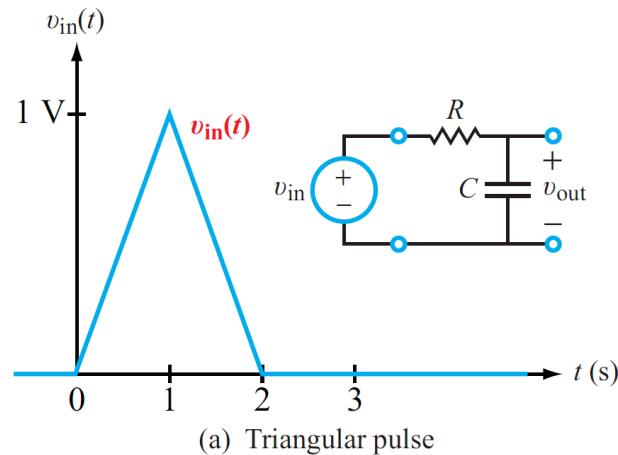

Solution:

The input signal, measured in volts, is given by

$$v_{\text{in}}(t) = \begin{cases} 0 & \text{for } t \leq 0, \\ t & \text{for } 0 \leq t \leq 1 \text{ s}, \\ 2 - t & \text{for } 1 \leq t \leq 2 \text{ s}, \\ 0 & \text{for } t \geq 2 \text{ s}, \end{cases}$$

the impulse response for $\tau_c = 1$ is

$$\begin{aligned} h(t) &= \frac{1}{\tau_c} e^{-t/\tau_c} u(t) \\ &= e^{-t} u(t). \end{aligned}$$

response of circuit with $RC = 1$ s to
triangular pulse

with

$$h(t - \tau) = e^{-(t-\tau)} u(t - \tau) = \begin{cases} 0 & \text{for } t < \tau, \\ e^{-(t-\tau)} & \text{for } t > \tau. \end{cases}$$

convolution - example

(1) $t < 0$:

The lowest value that the integration variable τ can assume is zero. Therefore, when $t < 0$, $t < \tau$ and $h(t - \tau) = 0$. Consequently,

$$v_{\text{out}}(t) = 0 \quad \text{for } t < 0.$$

(2) $0 \leq t \leq 1$ s:

$$h(t - \tau) = e^{-(t-\tau)}, \quad v_{\text{in}}(\tau) = \tau,$$

and

$$\begin{aligned} v_{\text{out}}(t) &= \int_0^t \tau e^{-(t-\tau)} d\tau \\ &= e^{-t} + t - 1, \quad \text{for } 0 \leq t \leq 1 \text{ s.} \end{aligned}$$

(3) $1 \text{ s} \leq t \leq 2 \text{ s}$:

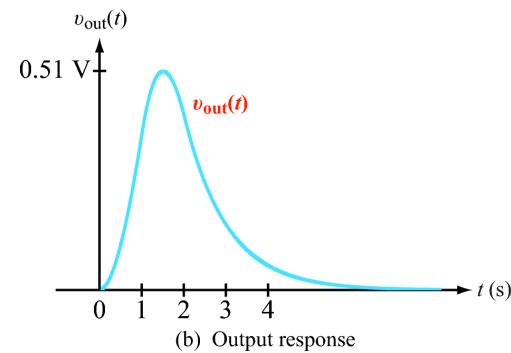

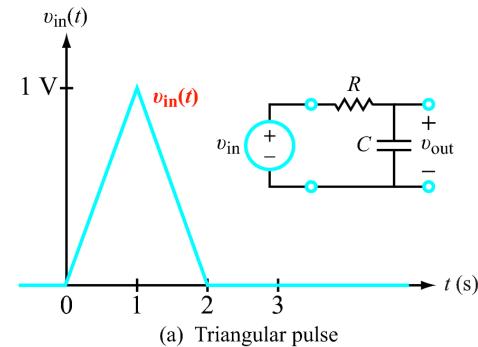

$$v_{\text{in}}(\tau) = \begin{cases} \tau & \text{for } 0 \leq \tau \leq 1 \text{ s,} \\ 2 - \tau & \text{for } 1 \text{ s} \leq \tau \leq 2 \text{ s,} \end{cases}$$

and

$$\begin{aligned} v_{\text{out}}(t) &= \int_0^1 \tau e^{-(t-\tau)} d\tau + \int_1^t (2 - \tau) e^{-(t-\tau)} d\tau \\ &= (1 - 2e)^{-t} - t + 3, \quad \text{for } 1 \text{ s} \leq t \leq 2 \text{ s.} \end{aligned}$$

(4) $t \geq 2$ s:

$$\begin{aligned} v_{\text{out}}(t) &= \int_0^1 \tau e^{-(t-\tau)} d\tau + \int_1^2 (2 - \tau) e^{-(t-\tau)} d\tau \\ &= (1 - 2e + e^2)e^{-t} \quad \text{for } t \geq 2 \text{ s.} \end{aligned}$$

convolution - example (2)

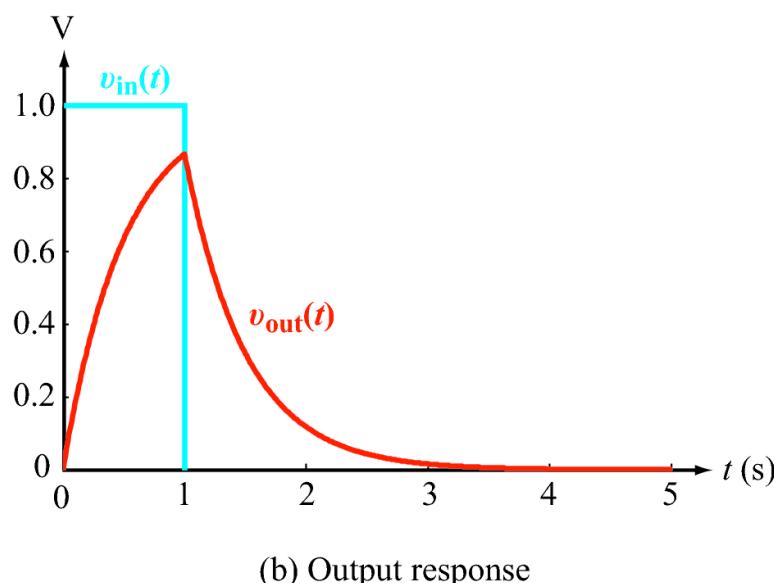

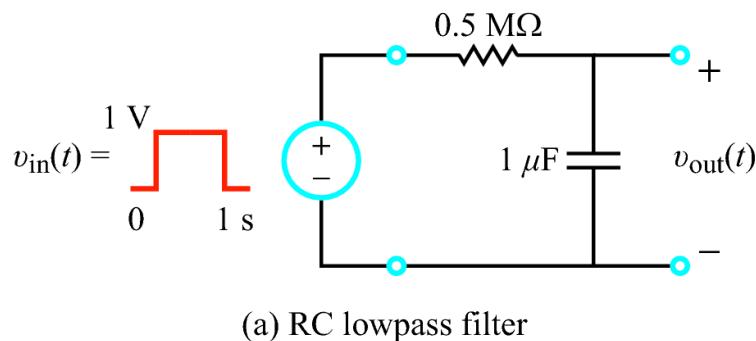

Solution:

The time constant of the RC circuit is $\tau_c = RC = (0.5 \times 10^6) \times 10^{-6} = 0.5$ s. In view of Eq. (2.17), the impulse response of the circuit is

$$h(t) = \frac{1}{\tau_c} e^{-t/\tau_c} u(t) = 2e^{-2t} u(t). \quad (2.53)$$

The input voltage is

$$v_{in}(t) = [u(t) - u(t - 1)] \text{ V}. \quad (2.54)$$

convolution - example (2)

$$v_{\text{out}}(t) = v_{\text{in}}(t) * h(t)$$

$$= u(t) \int_0^t v_{\text{in}}(\tau) h(t - \tau) d\tau$$

$$= u(t) \int_0^t [u(\tau) - u(\tau - 1)] \times 2e^{-2(t-\tau)} u(t - \tau) d\tau$$

$$= u(t) \int_0^t 2e^{-2(t-\tau)} u(\tau) u(t - \tau) d\tau$$

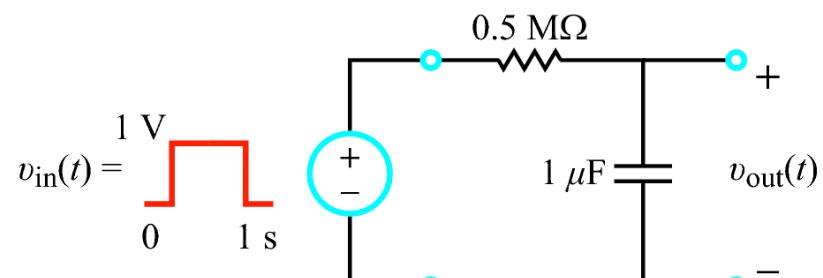

$$- u(t) \int_0^t 2e^{-2(t-\tau)} u(\tau - 1) u(t - \tau) d\tau.$$

$$v_{\text{out}}(t) = \left[\int_0^t 2e^{-2(t-\tau)} d\tau \right] u(t)$$

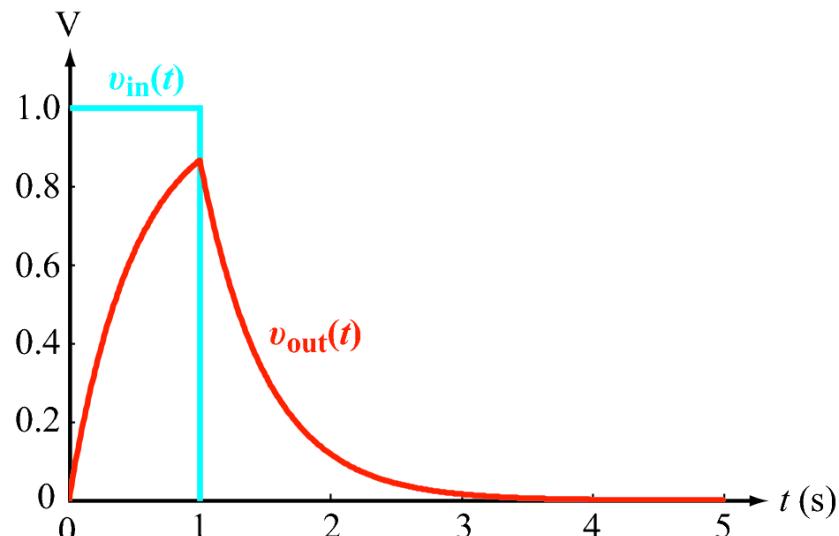

$$- \left[\int_1^t 2e^{-2(t-\tau)} d\tau \right] u(t - 1)$$

$$= \frac{2}{2} e^{-2(t-\tau)} \Big|_0^t u(t) - \frac{2}{2} e^{-2(t-\tau)} \Big|_1^t u(t - 1)$$

$$= [1 - e^{-2t}] u(t) - [1 - e^{-2(t-1)}] u(t - 1) \text{ V},$$

(a) RC lowpass filter

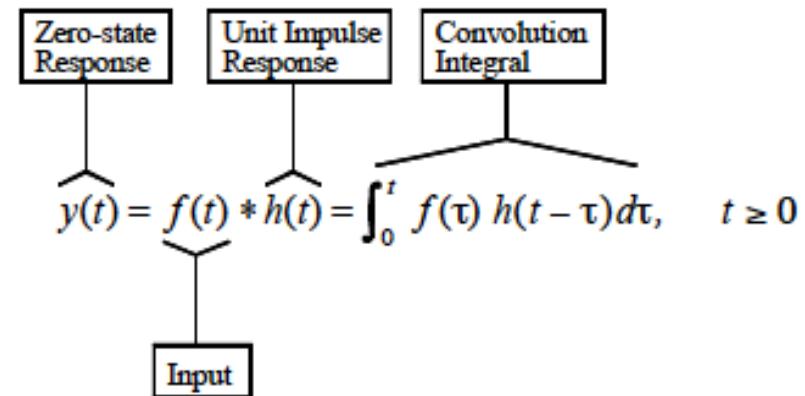

(b) Output response

convolution - zero state response

CONTINUOUS-TIME SYSTEMS

The **Zero-state Response** can be written as the **convolution integral** of the Input and the Unit Impulse Response. If $f(t)$ and $h(t)$ are causal, the limits of integration are 0 to t .

graphical convolution

Essentially the steps are FLIP, SLIDE, MULTIPLY and INTEGRATE.

The graphical steps are:

1. Plot $x(\tau) * h(\tau)$
2. select which signal to flip, say $h(\tau)$. In general, the signal of shorter duration is the one to flip, or the easier one.
3. Flip $h(\tau)$ about the vertical axis giving $h(-\tau)$.
4. Plot $h(-\tau + t)$ on τ axis, This is just $h(-\tau)$ shifted RIGHT by t .
5. Identify regions of overlap as t varies from $-\infty$ to ∞ where there are breaks in either function.
6. Multiply and integrate for each of the identified regions.

graphical convolution

Graphical understanding of convolution

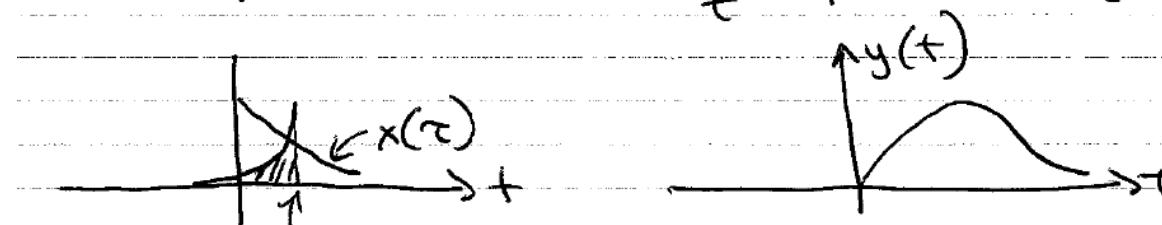

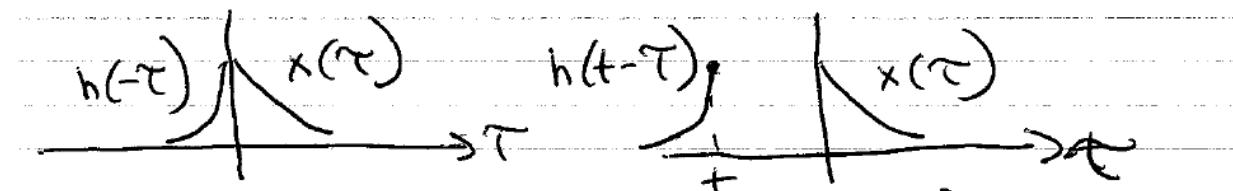

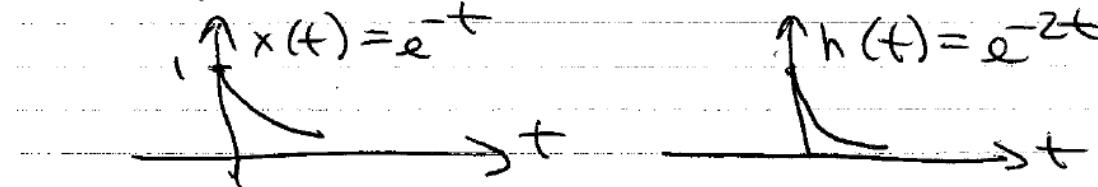

$$y(t) = x(t) * h(t) = \int_{-\infty}^{\infty} x(\tau)h(t - \tau)d\tau$$

$h(\tau) \rightarrow FLIP$ $h(-\tau) \rightarrow SLIDE$ $h(t - \tau) \rightarrow MULTIPLY$
 $x(\tau)h(t - \tau) \rightarrow INTEGRATE$ $\int_{-\infty}^{\infty} x(\tau)h(t - \tau)d\tau$

graphical convolution

Example 5 Graphical cts.

sum all
areas under
curve that resulted
to sliding here

graphical convolution

Example 6 Graphical Continuous (cts.)

$$y(t) = u(t) * [u(t) - u(t-1)]$$
$$= \begin{array}{c} \text{↑ } u(t) \\ \hline \end{array} * \begin{array}{c} \text{↑ } u(t) - u(t-1) \\ \hline \end{array} = h(t)$$

The diagram illustrates the convolution of two unit step functions, \$u(t)\$ and \$[u(t) - u(t-1)]\$. On the left, a vertical arrow labeled \$u(t)\$ points to a horizontal line segment starting at \$t=0\$. This represents the input signal \$u(t)\$. On the right, another vertical arrow labeled \$u(t) - u(t-1)\$ points to a pulse function starting at \$t=0\$ and ending at \$t=1\$, with a value of 1 between these points. This represents the impulse response \$h(t)\$. A convolution symbol \$*\$ is placed between the two signals, indicating their convolution.

convolution by integration

Example 7

Convolution by Integration

$$h(t) = e^{-2t} u(t)$$

?

$$x(t) = e^{-t} u(t)$$

impulse properties revisited

- ▶ An LTI system is causal *if and only if* its impulse response is a causal function: $h(t) = 0$ for $t < 0$. ◀

- ▶ An LTI system is BIBO stable *if and only if* its impulse response $h(t)$ is *absolutely integrable* (i.e., if $\int_{-\infty}^{\infty} |h(t)| dt$ is finite). ◀

convolution properties revisited

Convolution Integral $y(t) = h(t) * x(t) = \int_{-\infty}^{\infty} h(\tau) x(t - \tau) d\tau$

- Causal Systems: Replace lower limit with 0

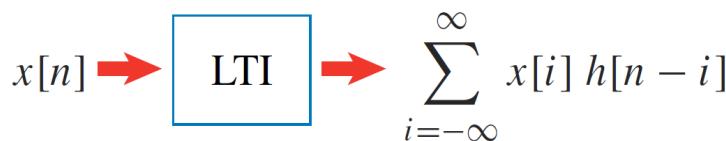

Property	Description
1. Commutative	$x(t) * h(t) = h(t) * x(t)$
2. Associative	$[g(t) * h(t)] * x(t) = g(t) * [h(t) * x(t)]$
3. Distributive	$x(t) * [h_1(t) + \dots + h_N(t)] = x(t) * h_1(t) + \dots + x(t) * h_N(t)$
4. Causal * Causal = Causal	$y(t) = u(t) \int_0^t h(\tau) x(t - \tau) d\tau$
5. Time-shift	$h(t - T_1) * x(t - T_2) = y(t - T_1 - T_2)$
6. Convolution with Impulse	$x(t) * \delta(t - T) = x(t - T)$
7. Width	Width of $y(t)$ = width of $x(t)$ + width of $h(t)$
8. Area	Area of $y(t)$ = area of $x(t)$ × area of $h(t)$
9. Convolution with $u(t)$	$y(t) = x(t) * u(t) = \int_0^t x(\tau) d\tau$ (Ideal integrator)
10a. Differentiation	$\left(\frac{d^m x}{dt^m} \right) * \left(\frac{d^n h}{dt^n} \right) = \frac{d^{m+n} y}{dt^{m+n}}$
10b. Integration	$\int_{-\infty}^t y(\tau) d\tau = x(t) * \left[\int_{-\infty}^t h(\tau) d\tau \right] = \left[\int_{-\infty}^t x(\tau) d\tau \right] * h(t)$

discrete vs. continuous convolution

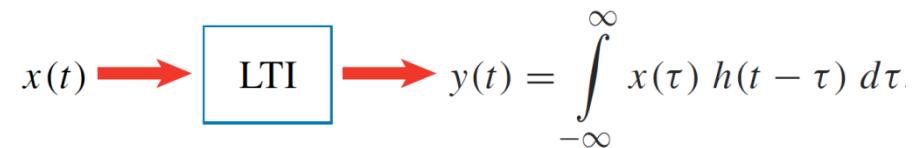

Discrete Time:

$$y[n] = x[n] * h[n] = \sum_{i=-\infty}^{\infty} x[i] h[n - i]$$

Continuous Time:

$$y(t) = x(t) * h(t) = \int_{-\infty}^{\infty} x(\tau) h(t - \tau) d\tau$$

discrete vs. continuous convolution

Property	Continuous Time	Discrete Time
Definition	$y(t) = h(t) * x(t) = \int_{-\infty}^{\infty} h(\tau) x(t - \tau) d\tau$	$y[n] = h[n] * x[n] = \sum_{i=-\infty}^{\infty} h[i] x[n - i]$
1. Commutative	$x(t) * h(t) = h(t) * x(t)$	$x[n] * h[n] = h[n] * x[n]$
2. Associative	$[g(t) * h(t)] * x(t) = g(t) * [h(t) * x(t)]$	$[g[n] * h[n]] * x[n] = g[n] * [h[n] * x[n]]$
3. Distributive	$x(t) * [h_1(t) + \dots + h_N(t)] = x(t) * h_1(t) + \dots + x(t) * h_N(t)$	$x[n] * [h_1[n] + \dots + h_N[n]] = x[n] * h_1[n] + \dots + x[n] * h_N[n]$
4. Causal * Causal = Causal	$y(t) = u(t) \int_0^t h(\tau) x(t - \tau) d\tau$	$y[n] = u[n] \sum_{i=0}^n h[i] x[n - i]$
5. Time-shift	$h(t - T_1) * x(t - T_2) = y(t - T_1 - T_2)$	$h[n - a] * x[n - b] = y[n - a - b]$
6. Convolution with Impulse	$x(t) * \delta(t - T) = x(t - T)$	$x[n] * \delta[n - a] = x[n - a]$
7. Width	$\text{width } y(t) = \text{width } x(t) + \text{width } h(t)$	$\text{width } y[n] = \text{width } x[n] + \text{width } h[n] - 1$
8. Area	$\text{area of } y(t) = \text{area of } x(t) \times \text{area of } h(t)$	$\sum_{n=-\infty}^{\infty} y[n] = \left(\sum_{n=-\infty}^{\infty} h[n] \right) \left(\sum_{n=-\infty}^{\infty} x[n] \right)$
9. Convolution with step	$y(t) = x(t) * u(t) = \int_{-\infty}^t x(\tau) d\tau$	$x[n] * u[n] = \sum_{i=-\infty}^n x[i]$

$x[n]$ $h[n]$

Compute the convolution $\{2,3,4\} * \{5,6,7\}$ using $y[n] = u[n] \sum_{i=0}^n h[i] x[n-i]$

Solution: The length of the convolution is $3+3-1=5$: $\{y[0] \dots y[4]\}$.

Compute each of $y[0], y[1], y[2], y[3], y[4]$ in succession as follows:

$$\begin{aligned}y[0] &= 0 \\y[1] &= 27 = 12 + 15 = 27 \\y[2] &= 14 + 18 + 20 = 52 \\y[3] &= 21 + 24 = 45 \\y[4] &= 28 \\y[5] &= 0\end{aligned}$$

$$y[n] = 0, n \geq 5, n < 0$$

computing discrete convolution 6

Compute the convolution $\{2,3,4\} * \{5,6,7\}$ graphically.

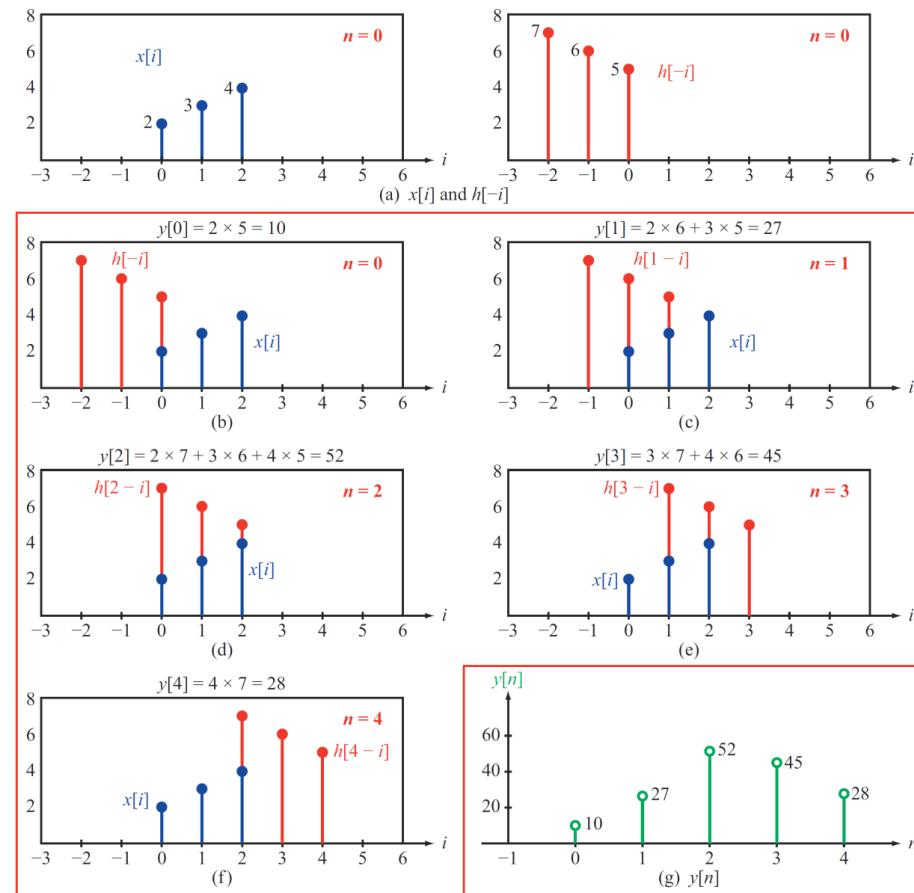

Figure 7-12: Graphical computation of convolution sum.

computing discrete convolution 7

Example 4

find $y[k] = (.8)^{k+1} u[k] * u[k]$

$$y[n] = \sum_{n=-\infty}^{\infty} (.8)^{n+1} u[n] u[k-n]$$

$$u[n] = 0 \quad \forall n < 0 \Rightarrow$$

also n cannot be $> k$ or its just zero

∴ limit of summation is k

$$\therefore y[n] = \sum_{n=0}^k (.8)^{n+1}$$

use

$$\sum_{k=m}^n r^k = \frac{r^{n+1} - r^m}{r-1} \quad \rightarrow \quad .8 \left(.8^{k+1} - .8^0 \right)$$
$$= 4 (1 - .8^{k+1})$$

CONVOLUTION $y[k] = x_1[k] * x_2[k]$

-discrete $= \sum_{n=0}^{\infty} x_1[n] x_2[k-n]$

-continuous $y(t) = \int_{-\infty}^{\infty} x(\tau) h(t-\tau) d\tau$

 $= x(t) * h(t)$

- ① integration
 - ② tables
 - ③ graphically
- Ways of Solving

$\delta(t) \rightarrow [H] \rightarrow h(t)$ impulse response

$\delta[n] \rightarrow [H] \rightarrow h[n]$ function

- if we know $h(t)$ / $h[n]$ we can find response of system to any other input $x(t)$ / $x[n]$

$y(t) = x(t) * h(t)$

$y[n] = x[n] * h[n]$

- graphical method of convolution

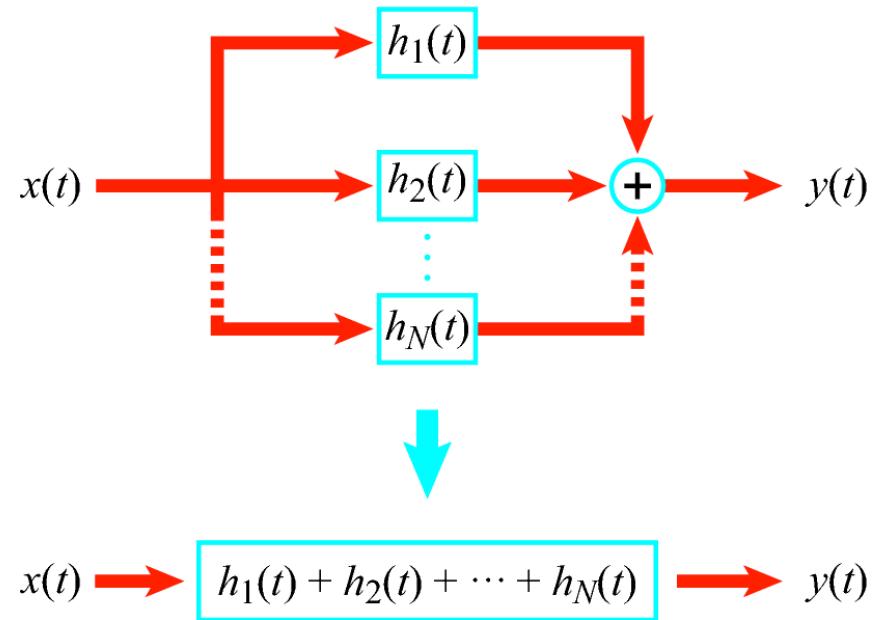

FLIP, SLIDE, MULTIPLY, INTEGRATE

Systems Connected In-Series

$$x(t) \rightarrow h_1(t) * h_2(t) \rightarrow y(t)$$

Systems Connected In-Parallel

$$x(t) \rightarrow h_1(t) + h_2(t) + \dots + h_N(t) \rightarrow y(t)$$
